If the master BY value precedes the transaction BY value, SAS reads from the master data set only and sets the unique variables from the transaction data set to missing. If the BY values in the master and transaction data sets are equal, it applies the first transaction by copying the nonmissing values into the program data vector.

Tables in SQL Server cannot have more than one clustered index. This makes sense because a clustered index is an ordered index and you cannot order the records of a table (a fixed structure) in more than one way. Listing 2 shows us how we can identify the clustered index sitting on table Tab1. We can also see this visually as shown in Fig. 5
