We have seen how the GroupBy abstraction lets us explore relationships within a dataset. A pivot table is a similar operation that is commonly seen in spreadsheets and other programs that operate on tabular data. The pivot table takes simple column-wise data as input, and groups the entries into a two-dimensional table that provides a multidimensional summarization of the data.

@FactorMystic First Normal Form requires that you not put multiple values in a single field. It's literally the first rule of an RDBMS. A SPLIT() function is not supplied because it encourages poor database design, and the database will never be optimized to use data stored in this format. The RDBMS is not obligated to help developers do stupid things that it has been designed not to handle.

For example, the only way we know so far to find the null space is to intuitively, using some abstract mental math, think of a combination of x, y, and z that combine to form 0. Here it's quite easy, after we realize the second column is just two times the first. Our (only) null space vector is c [-2, 1, 0] or something along that line.
